COST BARRIER BEYOND
A BALL AND AN
UPLOAD

A GLOBAL RANKING SYSTEM FOR FOOTBALL TALENT — BUILT BEFORE THE INFRASTRUCTURE EXISTS.

American football is growing in places that don't yet have the players, fields, or recruiting systems for a full team game. The old answer was to wait — build clubs, recruit rosters, host events, hope a sport forms. My House inverts it. 1v1 football needs almost nothing: three people and a yard. That low floor is the entire opportunity. The game can be played, filmed, and scored anywhere on Earth, before a single tournament is ever scheduled.

So we don't sell an event and market it with content. We make the upload itself the competition.

Every upload changes the standings.

That one sentence is the whole product: athletes post 1v1 reps to a single global ranking, climb it by demonstrated skill, and earn an invite to a real, in-person tournament judged by people who matter.

The stage door is open. We aren't waiting for the sport to grow — the rank is the growth mechanism.

THE MOAT: ONE BOARD, ONE LADDER.

Most sports systems are fragmented — separate leagues, separate regions, none of them comparable. My House is unified. One board, one scoring system, one global ranking. A kid in Lagos, a kid in Mumbai, and a kid in Miami are all measured on the same ladder, by the same rubric, for the same points.

The unification is the moat. Anyone can host a video upload or run a youth event; almost no one can credibly say a throw in Manila and a throw in Dallas rank against each other on one honest ladder.

The board is the infrastructure. Rank is the product.

Nobody loves a leaderboard. People love what a leaderboard tells them about themselves. The thing an athlete obsesses over is not "I use My House" — it is "I'm #8 in Europe" or "I finally cracked the Top 100." Rank is identity. Identity travels: athletes share their rank, and the rank carries the platform with it. That is the acquisition engine.

COMPETITION IS LIVE.

Yes, the game already has rankings — 247, Rivals, On3. But those rank the talent the system has already reached: the kids with camps, combines, film, and coaches. They are a ranking of the already-discovered. My House is the first ranking open to everyone the system was never built to reach — the kid in Accra, the girl in Manila, the yard in Mexico City. Access is the difference, and it is the whole difference.

It also doesn't compete on the axis the social platforms own. Instagram, TikTok, YouTube: post your video, get views. My House is a ranking system, not a publishing platform.

THE UPLOAD IS A PERFORMANCE.

THE THING	ON A SOCIAL PLATFORM	ON MY HOUSE
The upload	Content	A performance
The profile	A profile	A record
The feed	A feed	A competition floor
The leaderboard	A feature	The product
Attention	The terminal reward	A reward of rank, toward opportunity

You don't upload a clip and hope to get discovered. Every upload changes the standings. A kid in Los Angeles uploads. An hour later a kid in Accra jumps him. The next morning someone in Jakarta takes the spot. The competition never sleeps, because the board never closes.

The truest comparable is a ranked ladder, not a media platform.

The psychology is the one behind ranked competitive gaming — someone opens the app because their rank moved overnight. That standing reason to return exists with no event scheduled and no new clip posted. Most sports organizations can't offer it, because their competition only exists on event day. My House's competition exists every day.

Attention is a reward of rank, never the goal.

The athlete's loop is Perform → Rank → attention and opportunity follow → Perform again. The moment getting-seen becomes the goal, you've rebuilt social media. Keeping attention downstream of rank is what keeps My House measured by who is climbing and qualifying, rather than by time-on-app.

“I moved up 14 spots today.” “I’m #3 in Brazil.” “I just got passed by a kid in Seoul.” When people talk that way, we’ve become a sport.

EVERY ATHLETE STARTS UNRANKED.

That is the most important word in the system, because it makes the bottom of the board a beginning, not a failure. A kid at rank #4,000 isn't losing — they are on the ladder, climbing.

UNRANKED → LOCAL → NATIONAL → GLOBAL → INVITE

That journey needs no explanation. Every great competitive system — chess, ranked gaming, combat sports — has this ascent built into it. The stage door is open to anyone; what you do once inside is climb a real hierarchy. The open door makes the rank meaningful. The rank makes the open door matter — an open door to a real ladder is opportunity.

THE BOARD.

One session, three boards.

A single afternoon of reps feeds three independent role profiles — QB, Receiver, Defender. Each athlete posts their own wins. The footage from both sides of enough sessions cross-checks itself: if a QB posts completions and the defender from the same session posts stops, the math has to reconcile. The posting structure is itself a verification mechanism.

Self-demonstrated, not opponent-relative.

You post reps that show your skill. Didn't win this one? Go again until you do. The board is a record of demonstrated ability — a ceiling, the way recruiting tape already works.

Twenty-four live leaderboards.

Three roles across four age divisions (U12, U15, U18, 19+ Open), on separate boards for girls and boys, women and men — same system, same rules, same rubric, run in parallel. Every athlete gets a real, reachable #1 of their own to chase.

Open to everyone, by design.

Women's and girls' football has almost no discovery infrastructure anywhere on Earth, which makes the board's pure meritocracy a genuine first stage for talent the system has never reached. Separate gender boards exist for the same reason age brackets do: to keep competition fair and the top reachable. Inclusion is built into the architecture.

Scored for legitimacy, not popularity.

Most of every score is execution — points for doing the job correctly, judged against a published rubric. A measured difficulty bonus rewards the harder rep. A small, capped crowd bonus lets the spectacular travel without ever letting popularity out-rank skill.

ONE WORLD BOARD. MANY STAGES.

Every athlete on Earth is scored identically. A throw in Seoul and a throw in São Paulo are the same test, ranked on the same ladder. Separate regional leagues would rebuild the borders the whole model exists to erase.

Geography is a lens, not a league.

On top of the one global ranking, an athlete can view the board through any filter — city, country, region — and see where they stand. The best thrower in a region doesn't stare at global rank #4,000 and quit. They are #1 where they are, on a reachable stage, while still measured against the world.

Most people will never be the best in the world. A lot of people can be the best somewhere that matters to them. Every stage we add is another reason to keep posting.

The stages ladder toward one summit.

Regional slices seed regional tournaments. Regional winners ladder up toward a single global championship. Any yard to the world stage. The ranking never resets — scores accumulate, so there is always a reason to post and the board never goes dark. A recurring season snapshots the board to seed the qualifier ladder. The board is the ocean, always there; the season is the tide that pulls toward one shore.

ACCESSIBILITY IS THE PRODUCT.

No cost barrier beyond a ball and an upload. The board is open to the world. The invite-only tournaments carry no entry fee — earned on points plus a human's judgment. The long-term goal is to subsidize even the ball and the upload, so the floor approaches zero.

If you have three people and a yard, you have a gridiron. That's the whole promise. Keep it.

The moment competing requires being somewhere specific, owning something expensive, or knowing someone, the reach collapses and My House becomes just another local circuit. The design exists to protect the floor.

VOTES FOR REACH. JUDGMENT FOR LEGITIMACY.

Two currencies, spent in the right places. Votes drive reach — they make a clip travel and acquire the next athlete with zero ad spend. Human judgment grants legitimacy — coaches, college players, and pro names make the final tournament selection at their discretion. Votes get you seen. Judgment gets you in.

If votes alone ever decided who competes, the board would rot into a popularity contest. The separation is deliberate and permanent.

Sequencing.

Public voting is built from the start but launched dark — recorded, not yet scoring — until the cohort is dense enough that votes mean reach rather than a clique. The first cohort's board ranks on rubric alone, so their first impression is that the best athlete wins, not the most popular.

WHY FRAUD WON'T DESTROY THE BOARD.

An open, global, upload-driven board will be attacked — synthetic footage, fabricated players, profile-farming. We don't brace for that; we designed for it. As AI-generated video gets good enough to fool a screen, the only defense that holds is one that never depended on the screen in the first place.

Fake your way up, and you'll fail where it counts — in front of people who'll know.

The prize is a physical, in-person, human-judged tournament, and you cannot fake your way onto a real field. A synthetic clip that earns an invite fails at the invite — the fraud doesn't pay. Legitimacy is conferred on a field by a human, never on a screen by an algorithm, and that line holds no matter how good the fakes get.

So fraud can corrupt reach, but never legitimacy. The two are walled apart on purpose. On the daily board, the crowd flags what looks off, cross-session reconciliation makes profile-farming expensive, and the submission cap keeps the feed clean — but none of that has to be perfect, because the board only nominates. The field decides. Integrity rests on architecture, not on a detection arms race we'd be doomed to lose.

THE HARD QUESTIONS.

The easy questions about a concept like this are the wrong ones. Here are the three that actually decide whether it works — and the answer to each, because a question without an answer is just a worry.

1 THE FIRST HUNDRED ATHLETES, NOT THE MILLIONTH.

An empty leaderboard is a dead page. The hardest problem is cold-start: what makes the second athlete upload when the first is ranked #1 of one. The answer is to seed narrow, not wide — a single dense cohort in one place where a real local tournament is already the prize, so the board is full and the invite is real from day one. Global reach is the destination; a hot, crowded corner is the start. We win one yard before we claim the world.

2 JUDGMENT CAN'T HAND-SCORE THE PLANET.

Human experts scoring every upload doesn't scale — and full automation reopens the consistency and gaming problems human judgment was there to close. The resolution is a staged hybrid: humans score the pilot; as volume grows, machine assistance triages and flags, but humans always make the invite. Automation sorts the queue; it never grants the prize.

3 MOST OF THESE ATHLETES ARE MINORS.

They're already filming themselves, and already uploading — to platforms built to hold their attention, not develop their game. My House doesn't create that behavior; it gives it a destination with a purpose. The same rep that disappears into a feed becomes a ranked, structured step on a real ladder. The incumbents monetize the child's attention. We never do — we monetize the competition, never the child. That is the difference that earns the platform its place.

And it's built so the safe path is the only path. Minors compete through guardian-managed accounts. Selectors never contact an athlete privately — every approach runs through the platform and the guardian, by design. Divisions are age-verified at the invite step. Safety isn't a policy bolted on; it's the architecture.

HOW WE BUILD IT.

Own the leaderboard. Rent the video.

Video hosting is expensive and commoditized — we rent it. The leaderboard is cheap to run and is the actual asset — we own it outright. The first build is a thin web app: capture a rep in the tool, the record and ranking stored in our system, a feed with voting, an owned leaderboard, and a private judge view for manual scoring. The full capture-own-push-return-monetize model follows.

Don't overbuild the pilot.

Scoring stays manual until the rubric numbers stop moving. Anti-fraud capture waits until we've seen how people actually cheat.

The pilot's primary objective is rubric consistency — not growth.

Can two judges in different countries watch the same rep and give nearly the same score? If yes, the board is credible and a coach can trust it. If no, the board is social media with a football skin. This is the root of integrity, too: a rubric tight enough that two judges agree is a rubric hard to game, because ambiguity is what fraud exploits. Inter-judge agreement and fraud-resistance are the same property viewed twice.

CAPTURE IN THE TOOL. PUSH TO THE WORLD. COMPETE ON THE BOARD.

Accessibility is paramount — but the easy path most people imagine is the one that quietly destroys the business. You cannot live on someone else's platform and own anything. So the model inverts every obvious instinct, and that inversion is what makes it work.

Capture — the tool is the reward, not a hoop.

Athletes record reps inside the My House tool — web-first, no app-store gate. The camera opens and the throwing-window clock is built into the recording, so the rule is enforced at the moment of capture. It's built for a cheap phone on a weak connection — low-resolution by default, compressed on-device, resumable uploads, record-offline-and-submit-on-wifi — because that phone, on that connection, is the customer. The tool is the reward: it hands back a ranked, branded, share-worthy clip the raw camera can't produce. Verification rides along for free inside the thing the athlete already wanted.

Own — the record is yours, always.

The video bytes sit on rented, commodity hosting. The record — athlete, role, division, score, rank, and the clip itself — lives in My House's own system. We never depend on a social platform to store, serve, or rank. The board is owned, the data is owned, the audience relationship is owned. That is the asset, and it is the only thing that can be monetized.

Push — social is the billboard.

Every rep produces a clean, branded vertical clip — rank and My House mark burned in — designed to be shared out to the athlete's own Instagram and TikTok. We don't pull video off social platforms; you can't do it reliably, and you shouldn't build a front door on land you can be evicted from. We push branded clips to them. Every shared clip is a free advertisement that recruits the next athlete. Social is distribution. The board is home.

Return — they come back to defend a rank, not to check a page.

A leaderboard you merely check is a dead page — looked at once, then forgotten. People return because their rank is under threat: “a kid in Nairobi just passed you — you dropped to #4.” Notifications, always-running competition, seasons with a ticking clock. This is the ranked-game retention model. That recurring, owned attention is the traffic — and the only traffic worth monetizing is the traffic you own.

Monetize — sponsor the competition, never the child.

Revenue comes from two engines. The primary engine: brands sponsor the competitive structure — seasons, challenges, regional tournaments, championships, and named divisions — an authentic association with global, inclusive, grassroots youth sport, with zero ads pointed at minors. The secondary engine: athletes and families can opt into premium tools that accelerate development and track progress — the climb itself always free. Merchandise and the stenciled championship ball support both, and the verified global talent map is a long-term, guardian-gated asset, never a raw data sale. Revenue scales with the prestige of the board, which scales with retention — profit and engagement are one flywheel. We monetize the competition, not the attention.

The clip is the flex. The rank is the hook. The board is the business.

The one question the pilot must answer before any of this is real: will an athlete choose to open My House to film a rep, because the clip it returns is better than raw footage and the rank is automatic? If yes, every other piece follows. If no, nothing does. That is the test under all the other tests.

HOW A REP IS SCORED.

Every rep produces a complete score from the rubric alone — no votes required. The crowd sits on top as a sealed, capped bonus. The two never touch the same number.

$$\text{Score} = (\text{Execution} \times \text{Difficulty}) + \text{Crowd spark}$$

COMPONENT WEIGHT SOURCE & PURPOSE

Execution base	70%	Rubric. Points for doing the job correctly. The bulk of every score — the grind loop, and what a coach trusts.
Difficulty	20%	Rubric. Measurable conditions known in advance — tighter window, longer throw, contested catch. Drives “post harder, not just more.”
Crowd spark	10%	Capped public-vote bonus. The un-measurable spark a rubric can't see. Can lift a great rep; can never make a weak one rank.

The defender is scored differently on purpose: outcome lies for defenders, so the base rewards coverage quality — positioning and contest, independent of whether the throw was missed — and a bonus rewards the stop actually caused. Base for the job; bonus for the play.

The throwing window — the regulation field.

The window makes a throw in Lagos and a throw in Miami the same test. It's provable from the footage itself — a visible clock or one continuous unbroken shot — so no official is required.

DIVISION WINDOW WHY

U12	5s	Developing arms; a generous window keeps reps completable.
U15	4s	Tightening as mechanics mature.
U18	4s	Same clock as U15 — separation comes from depth and opponent, not timing.
19+ Open	3s	Elite release under live pressure — the sharp gate at the top.

Point values and window seconds are a starting hypothesis, calibrated against real pilot footage. The principle — execution dominates, difficulty rewards skill, crowd only sparks — is fixed. The exact numbers are a dial, not a wall.

ROADMAP.

P1 PROVE THE LOOP.

A focused pilot cohort, one or two age divisions, web-only, rented video, owned leaderboard, manual scoring, voting dark. Run one real tournament for the top of the board, judged in person. The board is global from the first upload; the first tournament lands wherever it's cheapest to run — location is logistics, not identity.

P2 TURN ON REACH.

Flip voting live once cohort density makes it meaningful. Expand divisions. The first stenciled championship balls and the invite-by-a-name become shareable proof that travels across borders.

P3 THE WORLD PLAYS, AND A SEASON FORMS.

All twenty-four global leaderboards live. The geographic lens activates. A recurring season overlays the permanent ranking: regional slices seed regional tournaments that ladder toward a global championship. Athletes recruit athletes by posting their climb.

P4 THE GRADUATION.

The athletes developed through 1v1 now have the numbers, skill, and identity to fuel team formats. 7v7 isn't a separate business — it's what the board grows into, built on a player pool, a community, and a brand that already exist worldwide.

THE LARGER VISION

A BALL. A FEW YARDS. THREE PEOPLE.
NOW YOU HAVE A GAME.

UNDERNEATH THE FOOTBALL, WHAT THIS
BUILDS IS A **MERIT SYSTEM** — NO
GATEKEEPERS, NO GEOGRAPHY, NO POLITICS.
FOOTBALL IS SIMPLY THE FIRST DOMAIN.

1v1 builds the players. The players build the league. The board builds the world.

Every athlete starts unranked. Every athlete can
climb.
